

# Camp Pendleton Deer Report

## December 2019

Michael Tucker  
Camp Pendleton Game Warden  
Chief Warden  
[Michael.j.tucker@usmc.mil](mailto:Michael.j.tucker@usmc.mil)

# Agenda

- Camp Pendleton Deer Hunting
- How Deer Eat and Drink on Base
- Historic Management Practices
- Research Methods
- Recent Hunting Statistics
- Highlights/Lowlights for 2019
- Summary and Recommendations

# What Pendleton Deer Eat

- Malcolm Pious' 1989 Humboldt State Graduate Thesis: Forage Composition and Physical Condition of Southern Mule Deer
- Pious examined rumens of 126 deer
- Deer consumed 54.2% browse, 21.6% forbs, 9.4% grass, 6.5% fruits/seeds, 8.3% other
- 42 different plant species identified
- Males ate more browse and less forbs
- Fawns and yearlings ate more forbs and less browse
- Perhaps males larger rumen and lower metabolism allowed for less nutritious browse

# What Pendleton Deer Eat

- 21 species comprised bulk of diet:
  - 🌐 Browse: chamise, black sage, laurel-sumac, lemonade berry, white sage, coastal sagebrush, Engelmann oak, coastal live oak, flat top buckwheat, holly-leaf redberry, and toyon
  - 🌐 Forbs: filaree, monkey flower, lupine, bedstraw, wild cucumber, and sweet fennel
  - 🌐 Fruits: acorns

# What Pendleton Deer Drink

- Michael Tucker's 2009 CSU San Marcos graduate thesis "Is Wildlife in Coastal Southern California Water Limited?"
- Used guzzlers and statistical analysis of landscape over 2 years to predict presence of deer and use of guzzlers
- Deer did not move in or out of an area based on the presence or absence of a guzzler
- Deer likely picked their range based on food availability and commuted to water

# What Pendleton Deer Drink

- Deer visited guzzlers during the dry season, not during the wet season
- Initially, only 10% of guzzlers received visitation from deer
- Study indicated that deer would visit guzzlers 1 km away from creek beds and under 1500' in elevation
- Game Wardens and Sportsman's Club moved guzzlers and now all guzzler have received deer visitation.

# Pendleton Deer Hunting

- Utilizes the G10 or California AO Tag
- 250 G10 tags issued annually
- “Military Only” hunt
- Effort controlled by Game Warden’s office
- Ranked as 7 out of 107 zones in California in hunter satisfaction in CDFW 2014 poll
- Hunters “Very Satisfied” in poll, but feel deer population is “declining”

# Historic Practices

- Deer hunting started in 1955 on base
- 2013 Biologist recommends limited effort to 600 hunter days
- 2014 Hunter effort limited to ~ 675 hunter days
- 2015 G10 tags reduced from 400 to 250
- 2016 Focus on spreading effort throughout base
- 2017 Season moved to November to allow for more hunting areas on holiday weekends
- 2019 Muzzleloading season added (but not conducted due to fire danger rating)

# Helicopter Survey

- Low elevation helicopter surveys indicate a fluctuating herd
- Average size around 500 animals

## Base deer population by year

# Current Survey Techniques

- Helicopter survey hazardous, discontinued in 2016
- Base personnel struck a powerline in the helicopter in 2016 during survey (no injuries)
- UAVs: 2017-Present
- Deer Pellet DNA: 2017 (Volunteer Assisted)
- Cameras: Started in 2019, will continue annually

# UAVs

- 2017 Shadow by USMC Reservists could not locate deer
- 2018 Reaper flown by USAF Reservists could locate motionless deer lying in brush from 14,000 ft (infrared)
- 2018 Puma flown by USMC Active Duty could locate deer spotted by Scouts, but not by itself
- 2019 Reaper conducted a scientific count of deer on Camp Pendleton
- 2019 Puma flown in cold ambient conditions could locate deer when flown at 300' AGL

# UAV Future

- Use Puma for base wide survey and compare to Reaper results
- Present results at National Conference in 2020

# Pellet Collection

- 2017 study collected deer pellets in India Training Area (25 square kilometer area)
- DNA analysis (using deer tag funds) showed 35 individual deer in the area
- Males had 1 square km range
- Females had 2 square km range

# Camera Study

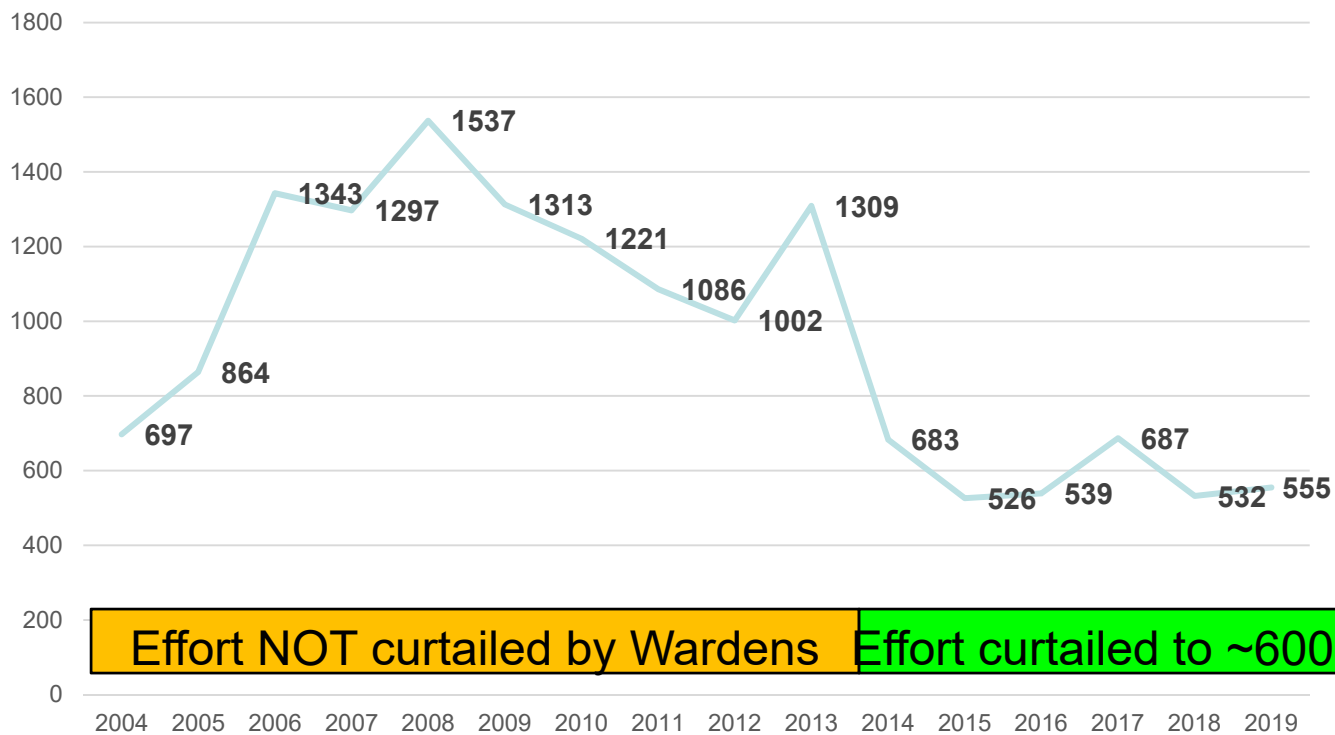

- 2019 Camera study placed trail cameras in 50 locations randomly throughout the base
- Deer present throughout most of the base, but more heavily concentrated in certain sections
- Brand new information to help future survey techniques
- Perhaps deer avoid southern exposure

# Deer Hunter Effort

- Effort fluctuated annually
- 2013 and prior hunters limited only by fires and area availability
- Effort intentionally reduced in 2014

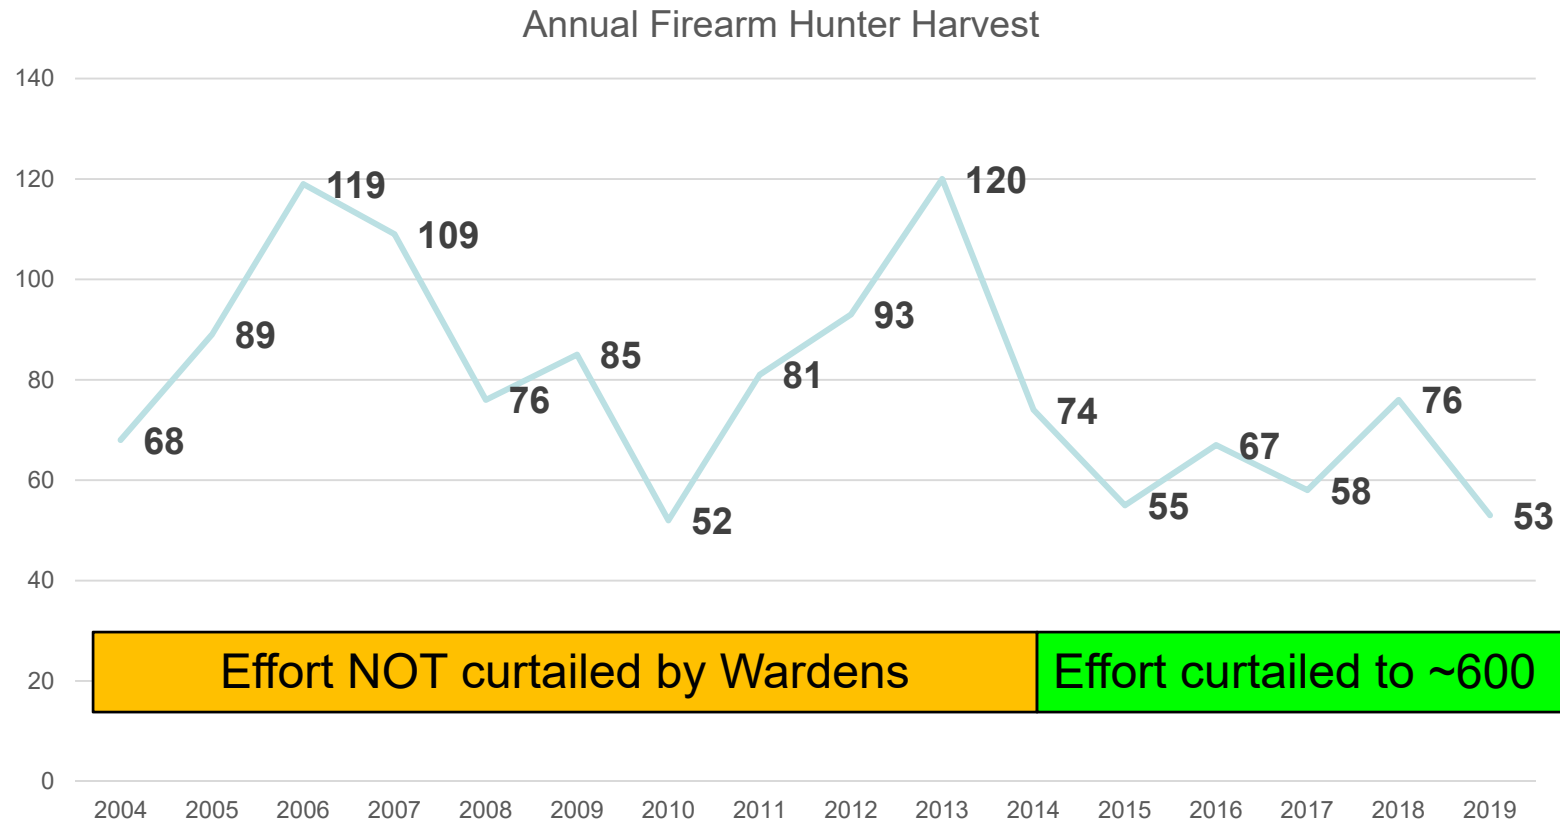

Annual Firearm Hunter Effort in Hunter Days

# Firearm Deer Harvest

- Harvest fluctuates each year
- Deer population fluctuations, hunting effort, and hunting area availability likely contribute to the peaks and valleys of this graph

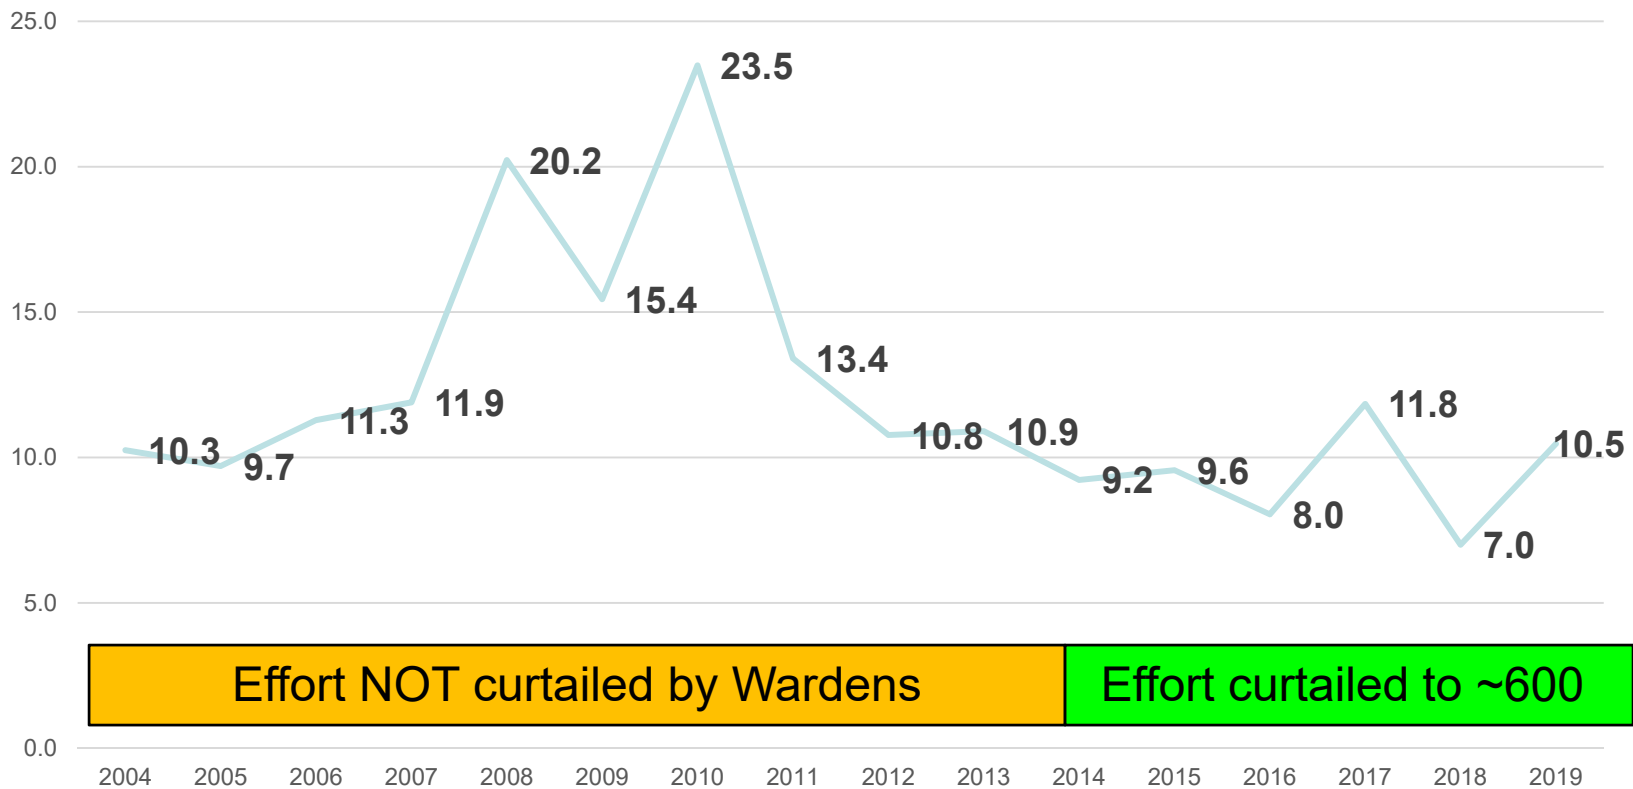

# Hunter Productivity

- The rate of deer harvest varies annually, LOWER IS BETTER
- Average is 12.6 hunter days per deer

Hunter Productivity: # days hunted per deer harvest

# Archery Harvest

- Record effort of about 900 archery hunts, many new archers
- Average harvest about 8 deer
- Archery effort not managed due to relatively low harvest numbers
- Inexperienced archers can maim deer, bowhunter courses coming in 2020

Archery Deer Harvested Annually

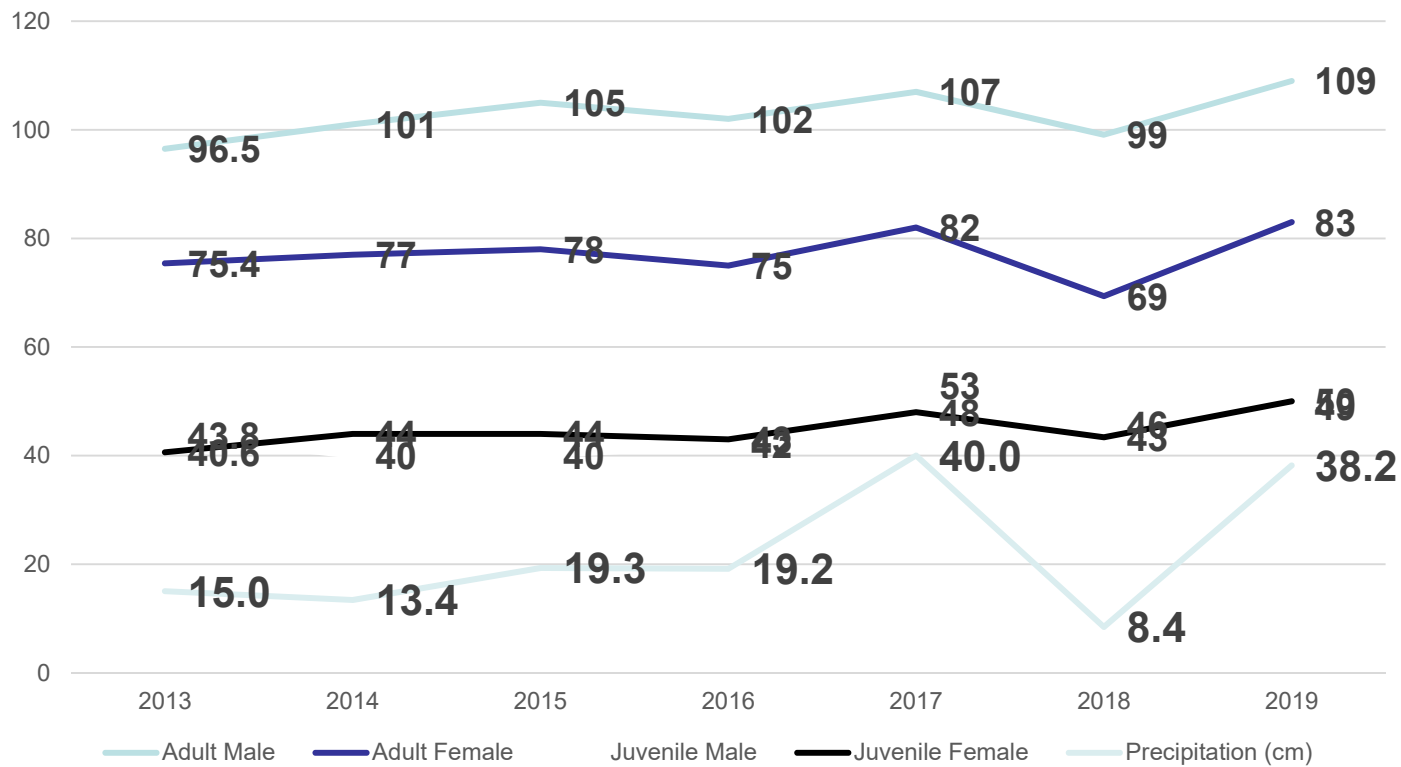

# Dressed Deer Weights

- Precipitation may affect deer weights, more precipitation=more weight
- Doe weight fluctuates more than buck
- Doe fluctuations have reproductive implications (twins, fawn health)

Average Annual Deer Weights, field dressed by class (lbs) with Precipitation (cm) from Oct-Sep

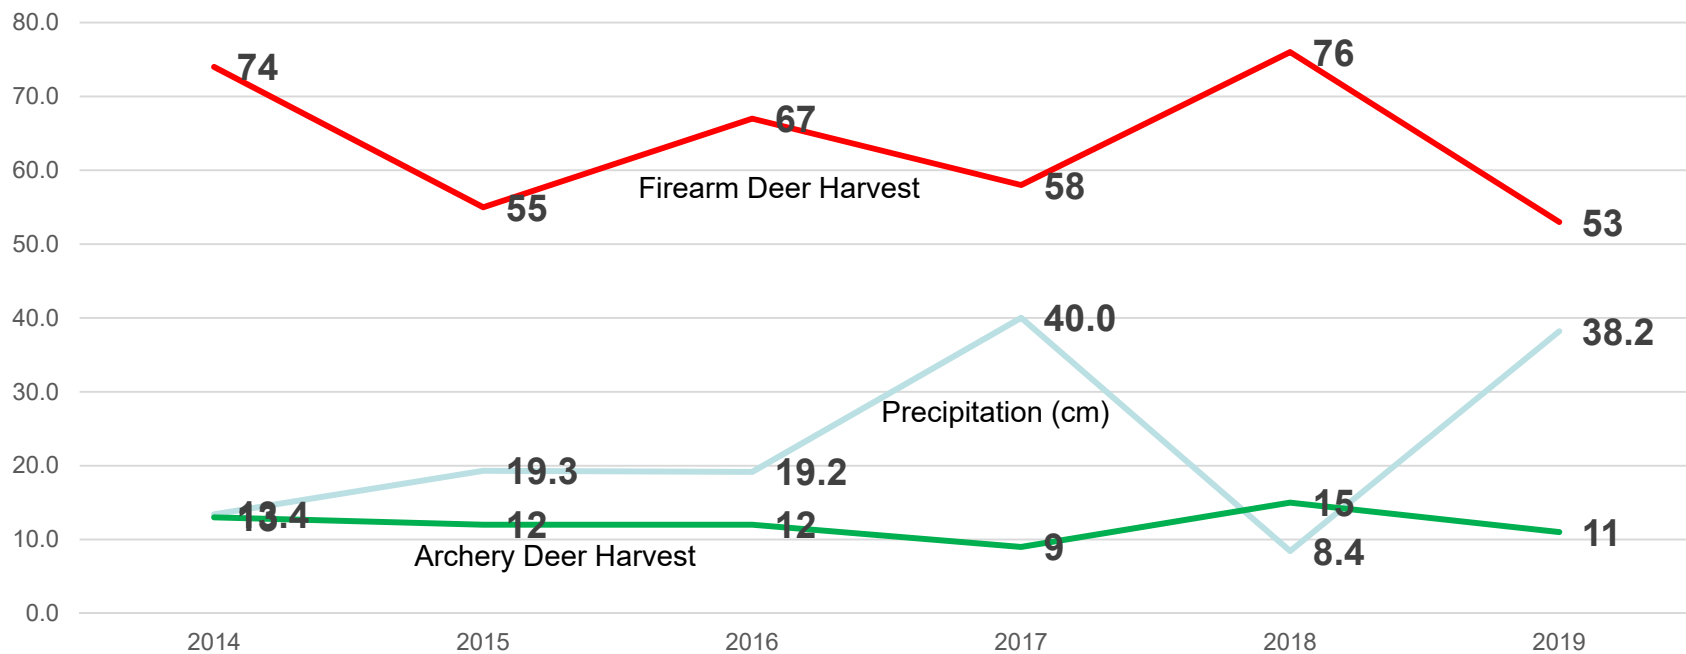

# Last year's precipitation driving harvest?

- The last 3 years of precipitation have wildly fluctuated
- 2017 high rainfall followed by a 2018 rise in firearm/archery harvest
- 2018 low rainfall followed by a 2019 drop in firearm/archery harvest
- Will 2019s high rainfall mean a high harvest in 2020?

Precipitation and Harvest

# Effort and Harvest by Area

- Historically productive Alphas, Papas, and Romeos under-hunted
- Intensity target between 3-4

2019 FIREARM DEER HUNTER INTENSITY AND HARVEST BY AREA  
(01DEC19)

# 2018 Deer Hunting Lowlights

- Many areas with great deer habitat not hunted much due to muddy roads or military training, under-hunting
- Beginning of the firearm season very hot (90s) and very windy, this negatively affected deer harvest
- “Extreme” fire danger rating cancelled muzzleloading
- One illegal spike deer taken (\$230 fine, deer hunting season over), donated to mountain lion research program for trapping/collaring in Southern California
- One hunter carried a bow in the field to help his spouse fill her tag after he already harvested a deer (\$230 fine, cannot purchase deer tag in 37 states until 2021, base hunting suspended for one year)

# 2019 Deer Hunting Highlights

- Archery effort highest on record (900 archery hunts)
- Biggest deer in recent memory >10% jump in weight
- Over 1500 trips to the field for archery and firearm deer hunters without injury or training interference
- 5x5 buck taken last day of season
- Largest buck 154lbs field dressed
- Many big antlered deer, “King of the Mountain in R2”
- 25 Guzzlers provided water throughout the dry season, receiving 100 deer visits/day

# 2020 Deer Hunting

- If heavy rainfall continues:
  - 🌐 Deer weights/antlers will stay big
  - 🌐 Deer population will recover from 2018 drought
- Muzzleloading season will be planned around weather patterns
- New archery range at Las Flores and introduction of advanced archery course

# Summary

- Camp Pendleton Deer Hunting appears
  - 🌐 SUSTAINABLE
  - 🌐 HIGH QUALITY
- The 2020 Hunt Will:
  - 🌐 Hunt 600 hunter days for firearm season
  - 🌐 Spread effort throughout base
- Measure 2018's precipitation effect on the 2020 harvest data
